

PRINCIPLES OF STATISTICS – EXAMPLES 1/4

Part II, Michaelmas 2015, RN (email: r.nickl@statslab.cam.ac.uk)

Throughout, the abbreviations ‘i.i.d.’, ‘pdf/pmf’ and ‘MLE’ stand for ‘independent and identically distributed’, ‘probability density/mass function’ and ‘maximum likelihood estimator’, respectively. A normal distribution in \mathbb{R}^d with mean vector μ and covariance matrix Σ is denoted by $N_d(\mu, \Sigma)$, and $N(\mu, \sigma^2)$ corresponds to the univariate case $d = 1$.

1. Consider an i.i.d. sample X_1, \dots, X_n of random variables. For each of the following parametric models of pmf/pdf's, find the MLE of the unknown parameter, the score equation and the Fisher information.

- a) $X_i \sim \text{i.i.d. Bernoulli}(\theta), \theta \in [0, 1]$,
- b) $X_i \sim \text{i.i.d. } N(\theta, 1), \theta \in \mathbb{R}$,
- c) $X_i \sim \text{i.i.d. } N(0, \theta), \theta \in (0, \infty)$,
- d) $X_i \sim \text{i.i.d. } N(\mu, \sigma^2), \theta = (\mu, \sigma^2)^T \in \mathbb{R} \times (0, \infty)$,
- e) $X_i \sim \text{i.i.d. Poisson}(\theta), \theta \in (0, \infty)$,
- f) $X_i \sim \text{i.i.d.}$ from model $\{f(\cdot, \theta) : \theta \in (0, \infty)\}$ with pdf $f(x, \theta) = (1/\theta)e^{-x/\theta}, x \geq 0$.
- g) $X_i \sim \text{i.i.d.}$ from model $\{f(\cdot, \theta) : \theta \in (0, \infty)\}$ with pdf $f(x, \theta) = \theta e^{-\theta x}, x \geq 0$.

2. In which of the examples of the previous exercise is the MLE unbiased (i.e., does one have $E_\theta \hat{\theta} = \theta$ for all $\theta \in \Theta$)? When unbiased, deduce whether the variance of the MLE attains the Cramér-Rao lower bound or not.

3. Let X_1, \dots, X_n be i.i.d. Poisson random variables with parameter $\theta > 0$, and let $\bar{X}_n = (1/n) \sum_{i=1}^n X_i, S_n^2 = (n-1)^{-1} \sum_{i=1}^n (X_i - \bar{X}_n)^2$. Show that $\text{Var}(\bar{X}_n) \leq \text{Var}(S_n^2)$.

4. Find the MLE for an i.i.d. sample X_1, \dots, X_n arising from the models a) $N(\theta, 1)$ where $\theta \in \Theta = [0, \infty)$ and b) $N(\theta, \theta)$ where $\theta \in \Theta = (0, \infty)$.

5. Consider an i.i.d. sample X_1, \dots, X_n arising from the model

$$\{f(\cdot, \theta) : \theta \in \mathbb{R}\}, \quad f(x, \theta) = \frac{1}{2} e^{-|x-\theta|}, x \in \mathbb{R},$$

of *Laplace distributions*. Assuming n to be odd for simplicity, show that the MLE is equal to the sample median. Discuss what happens when n is even. Can you calculate the Fisher information?

6. Consider observing an $n \times 1$ random vector $Y \sim N(X\theta, I)$ where X is a non-stochastic $n \times p$ matrix of full column rank, where $\theta \in \Theta = \mathbb{R}^p$ for $p \leq n$, and where I is the $n \times n$ identity matrix. Compute the MLE and find its distribution. Calculate the Fisher information for this model and compare it to the variance of the MLE. Deduce, as a special case, the form of the MLE and Fisher information in the case when $p = n$ and $X = I$.

7. Let $(X, X_n : n \in \mathbb{N})$ be random vectors in \mathbb{R}^k .

a) Prove that $X_n \rightarrow^P X$ as $n \rightarrow \infty$ if and only if each vector component $X_{n,j}, j = 1, \dots, k$, of X_n converges in probability to the corresponding vector component X_j of X as $n \rightarrow \infty$. Formulate and prove an analogous result for random symmetric $k \times k$ -matrices.

b) Suppose $E\|X_n - X\| \rightarrow 0$ as $n \rightarrow \infty$ where $\|\cdot\|$ is the Euclidean norm on \mathbb{R}^k . Deduce that $X_n \rightarrow^P X$ as $n \rightarrow \infty$.

c) Show that the converse in b) is false, that is, give an example of real random variables $X_n \rightarrow^P X$ as $n \rightarrow \infty$ but $E|X_n - X| \not\rightarrow 0$.

8. Given X_1, \dots, X_n i.i.d. random variables such that $EX_1 = 0, EX_1^2 \in (0, \infty)$, the *Student t-statistic* is given by

$$t_n = \frac{\sqrt{n}\bar{X}_n}{S_n}, \quad \bar{X}_n = \frac{1}{n} \sum_{i=1}^n X_i, \quad S_n^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X}_n)^2.$$

Show that $t_n \xrightarrow{d} N(0, 1)$ as $n \rightarrow \infty$. Assuming now $EX_1 = \mu \in \mathbb{R}$, deduce an asymptotic level $1 - \alpha$ confidence interval for EX_1 .

9. For the examples from Exercise 1, derive directly (without using the general asymptotic theory for MLEs) the asymptotic distribution of $\sqrt{n}(\hat{\theta}_{MLE} - \theta)$ as $n \rightarrow \infty$.

10. Suppose one observes *one* random vector $X = (X_1, X_2)^T$ from a bivariate normal distribution $N_2(\theta, \Sigma)$ where $\theta = (\theta_1, \theta_2)^T$ and where Σ is an arbitrary but *known* 2×2 positive definite covariance matrix.

i) Compute the Cramér-Rao lower bound for estimating the first coefficient θ_1 if a) θ_2 is known and b) if θ_2 is unknown.

ii) Show that the two bounds in i) coincide when Σ is a diagonal matrix.

iii) Show that the bound in i)a) is always less than or equal to the bound in i)b), and give an information-theoretic interpretation of this result.
